Presented methods

⌘ Traditional methods

Fourier transform

⌘ Parametrical methods

Autoregressive estimator

⌘ Nonlinear methods - Chaos theory

Delay-time embedding, Correlation dimension, State Space dimension

EEG activity

- ⌘ electric potential of brain's neural activity
- ⌘ registered on the skull
- ⌘ four basic frequencies

Name	Freq. [Hz]
Delta	0,5-4
Theta	4-8
Alpha	8-15
Beta	15-35

Traditional methods

Estimate of a periodogram using the Fourier transform

Potencial problems

- ⌘ Signal's stationarity
- ⌘ frequency resolution
- ⌘ leakage of frequency spectra
- ⌘ quality of the spectral estimate
- ⌘ phase of the signal is lost

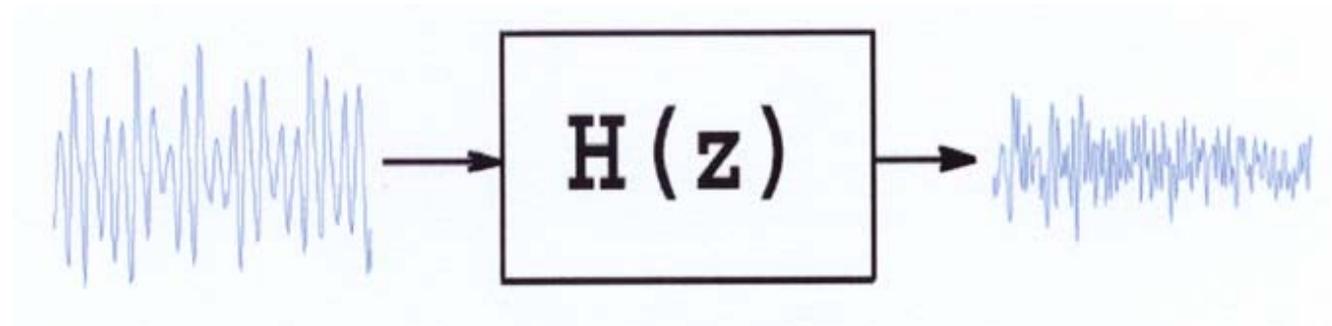

Parametrical model

Approximation of an EEG signal by adequate parametrical model

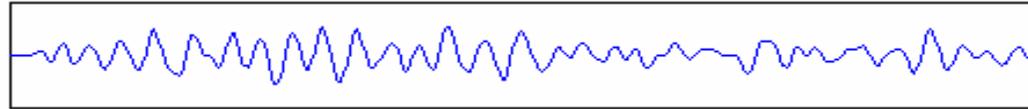

Autoregressive (AR) model:

Approximation of an EEG signal by linear time invariant filter with transfer function $H(z)=1/A(z)$

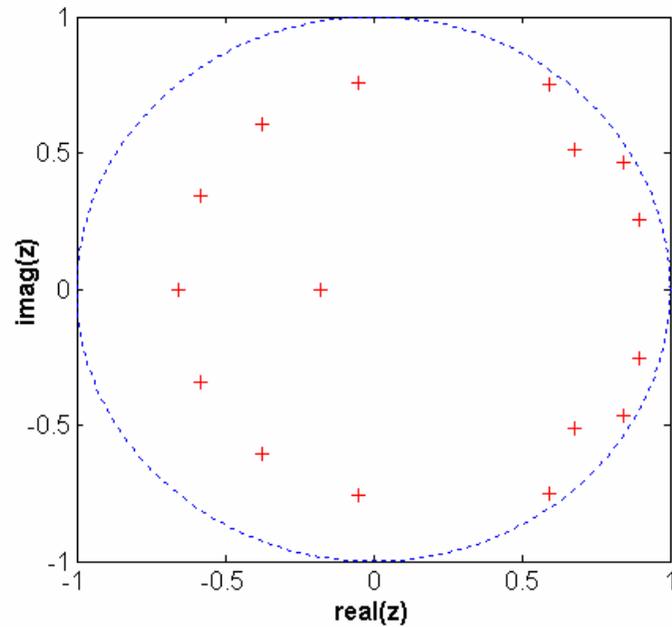

Whitening of signal by AR filter:

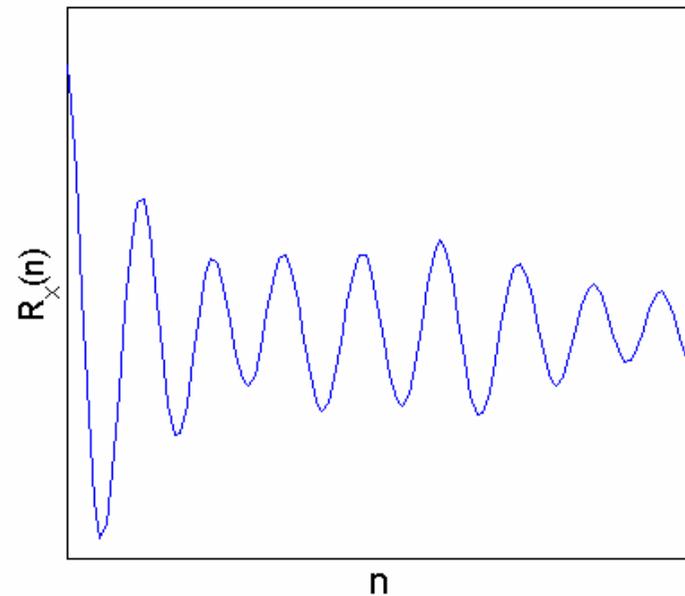

Analyzed signal

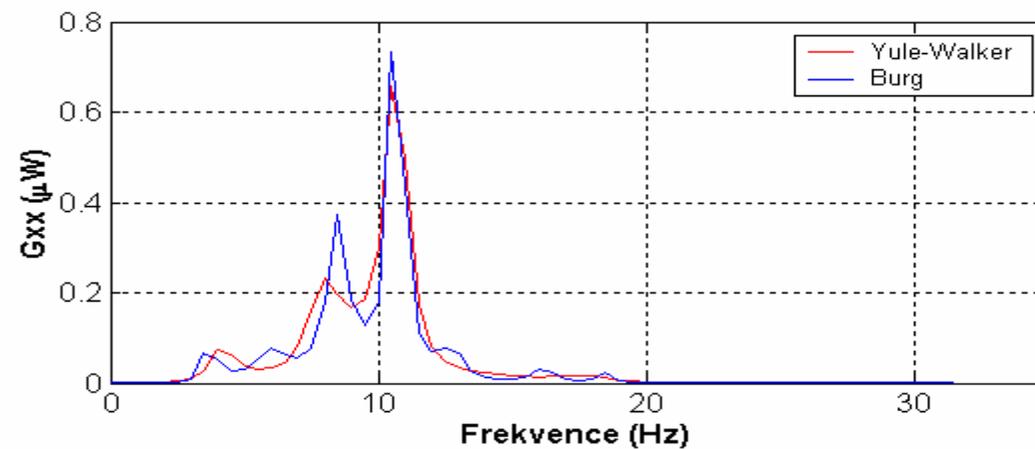

Pole placement

Autocovariance function

Spectral estimate

Comparison of traditional and parametrical methods

Traditional methods:

- + low noise sensitivity
- frequency resolution

Parametrical methods:

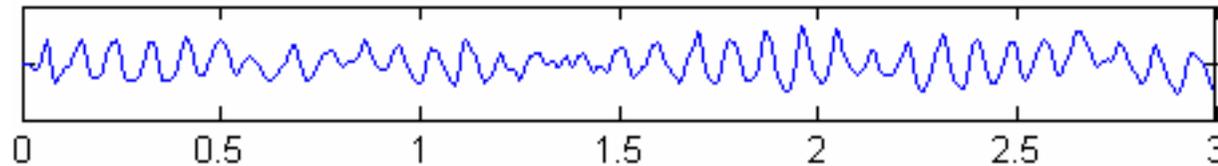

- + frequency resolution
- + parametrical description of analyzed signal
- estimate of AR model order
- high noise sensitivity

Chaos theory

- ⌘ Analysis of dynamic deterministic systems
- ⌘ high sensitivity on initial conditions
- ⌘ known dynamics and phase of the system
- ⌘ delay-time embedding
 - ⊠ state-space dimension estimate
 - ⊠ estimate of delay time
- ⌘ estimate of fractal dimension

Delay-time embedding

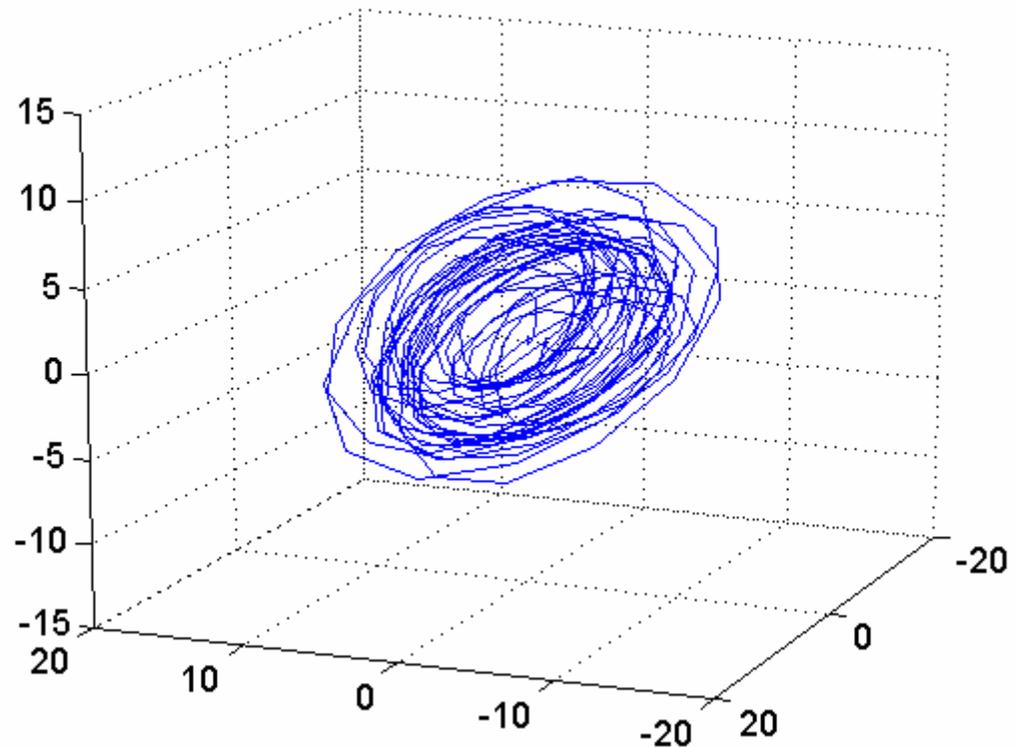

$$S_i = [x(i), x(i+L), \dots, x(i+(m-1)L)]$$

L... dime delay

S_i ... state-space vector

m... state dimension

x... analyzed signal

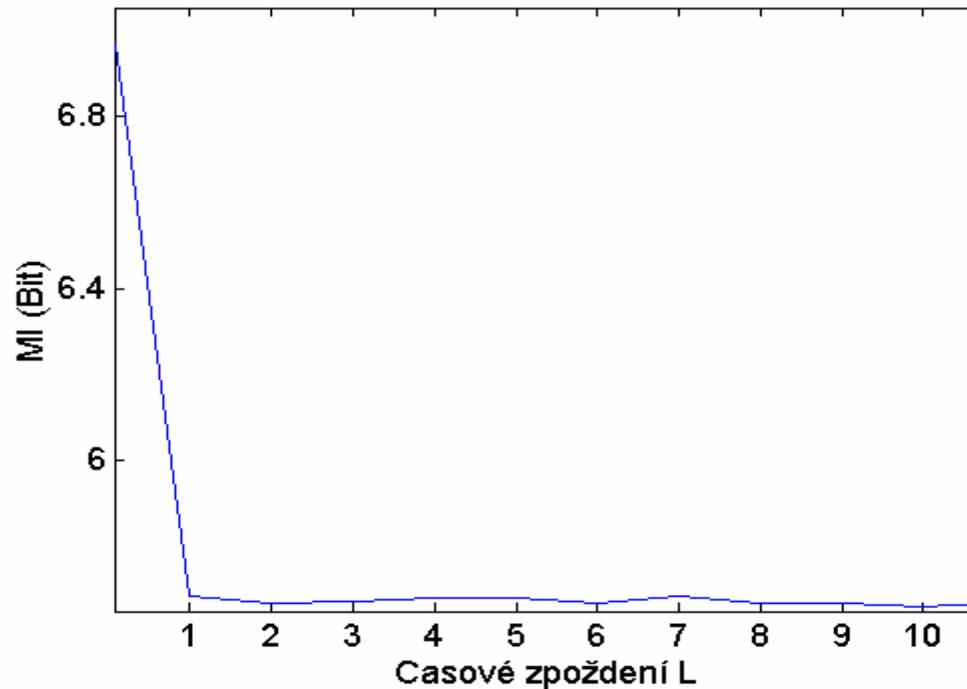

Selection of Delay Time L

Time delay should be set so, $x(i), x(i+L), \dots$ are independent

Autocorrelation
method
method of
Mutual
Information (MI)

Microsleep classification

Traditional methods

- ⌘ Alpha and delta activity of spectral estimate

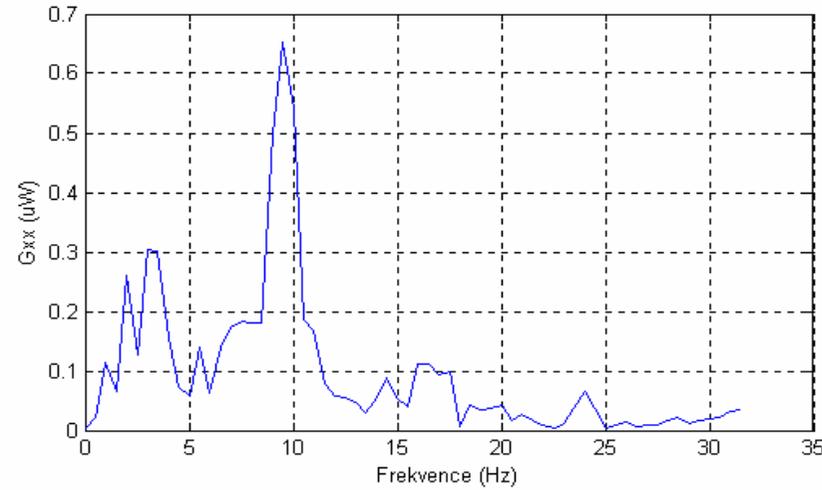

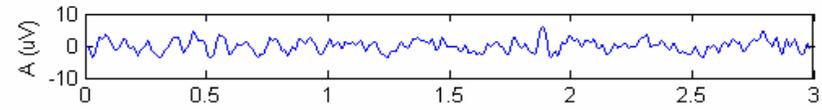

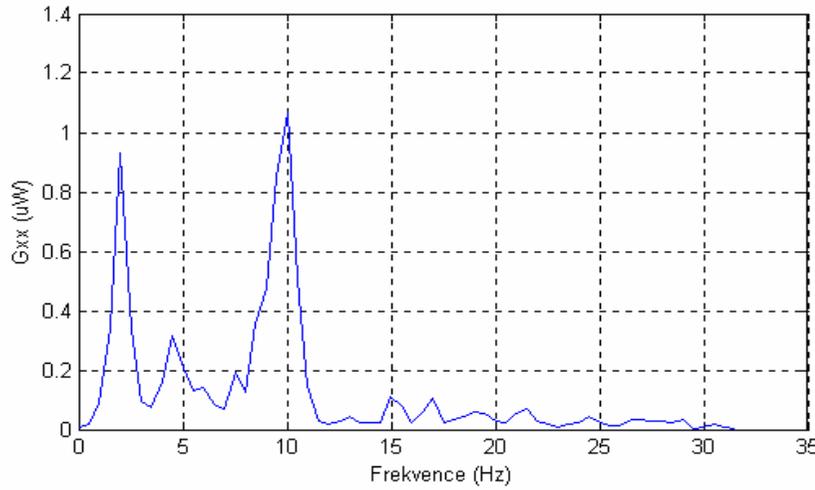

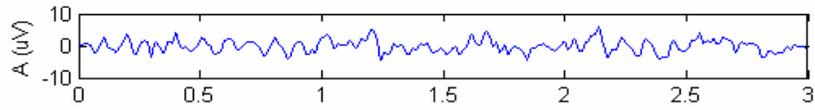

Parametrical methods

- ⌘ poměr alfa a delta aktivity spektrálního odhadu
- ⌘ estimate of AR model order
- ⌘ placement of poles in a complex plane

Chaos theory

- ⌘ State-space trajectory reconstruction
- ⌘ correlation dimension estimate

Relaxation

Drowsiness
